

CS396 Software Design Principles and Practices

Project: Milestone 2 Report

Project Progress Evaluation

- Revised Class Diagram:

- I have finalized the revised design and am ready to begin implementation next week. Although the project is currently running four days behind schedule due to an overly condensed initial timeline, the planned activities remain valid and necessary. My focus for next week (11/24 – 11/30) will be implementing the logic for the chosen card types, followed by testing and report writing the subsequent week (12/1 – 12/8).

Do You Have Any Questions About the Grading Rubrics?

No.

Do You Have Any Other Questions?

- The recent forum post (screenshot attached below) clarified that we only need to produce Use Cases for the 4 specific cards we are refactoring, rather than the entire deck. Building on that logic, I wanted to ask about the scope of the implementation: Since we are focusing deeply on refactoring these specific mechanics (Shuffle, Nope, Explosion, Swap), other features like maintaining the legacy support for Multiple Game

Modes (Streaking/Imploding Kittens) and different language adds significant complexity to the Domain Layer that isn't relevant to the refactored cards.

My Question is that, to demonstrate a clean design, may I align the implementation with the reduced scope of the Use Cases?

I would like to remove the unused Game Modes and Language logic to produce a polished, "pure" refactored demo of the 4 core cards, rather than a hybrid system that mixes the new design with the old messy code.

Is this acceptable? Thank you!

Anonymous 1w

a follow-up for option3. the project intro handout says the Software Requirement Document should include the list of use cases. for exploding kitty do we just describe the use cases based on the code? and does it need to relate to the 4 cards we choose to refactor? (although i feel like coming up with use cases makes more sense for only option 1 and 2...)

Option 3 requires use cases too. My intention is to use the use cases to demonstrate that you know how the software works.

However, your question makes me realize that it's crazy and unnecessary for folks to produce the use cases for all 20+ cards. So please produce the use cases for the 4 cards you will refactor.

Good question! Thanks for asking!
